A General Contractor is building a retaining wall in Sonoma County. The General Contractor is required to have the portion of the retaining wall which is over 3' tall designed by a licensed engineer. The base of the wall follows a driveway at a 6% slope. The top of the wall is level. The short side of the wall is 0.75 feet tall, and the tall side is 6.5 feet tall. How much of the wall needs to be designed by the licensed engineer? (Hint: When is the wall 3 feet tall?) (diagram not to scale)

I need to know where that wall is 3' tall

Please and thank you

(true story)
